ABSTRACT

This experimental study explores the effect of science fiction literature on the creativity of middle school students. Creativity, recognized as a vital skill in education, enhances students' problem-solving, imagination, and innovation capacities. Grounded in Torrance's model of creativity, the study employs a mixed-methods approach integrating pre- and post-intervention assessments and semi-structured interviews. A total of 60 students from Grade 8 were randomly divided into experimental and control groups. The experimental group received a four-week science fiction literature intervention involving multimedia and narrative formats. The creativity was measured using Torrance Inspired Tests of Creative Thinking (TITCT). Results revealed statistically significant gains in creativity—especially in originality and fluency—among students exposed to science fiction. These findings emphasize the dual role of science fiction as a medium for fostering both creativity and scientific literacy in education.

INTRODUCTION

Creativity is a critical developmental skill during middle school years, promoting adaptive problem-solving, imaginative expression, and academic engagement. This study investigates the potential of science fiction literature to stimulate creativity among students through structured pedagogical intervention. Historically, science fiction has served as a platform for conveying futuristic and scientific ideas in compelling narratives, making it a promising tool for enhancing both cognitive and affective learning outcomes.

In light of declining interest in traditional learning materials and the increasing need for creativity-driven instruction, this study addresses gaps in the literature concerning the integration of imaginative literature—specifically science fiction—into the middle school curriculum. The study of creativity in learning is a major field of inquiry, especially in relation to middle-level school students who are reaching a critical stage of development. Supported by Torrance's theory of creativity, the study examines whether science fiction can effectively foster fluency, originality, and flexibility in students' thinking. It studies the impact of science fiction on promoting creativity among middle school students, utilizing an experimental design.

Historically, science fiction has also been an effective instructional tool, depicting complex ideas while making them more engaging through critical thinking for students. The relevance of this type of genre becomes better understood when examining its ability to promote both creativity and scientific literacy.

Creativity is an inherent aspect of learning, and enables students to push beyond the ordinary boundaries and explore content in active forms. This paper aims to elaborate on why creativity is crucial in educational settings; it allows for problem-solving, enhances engagement, and inspires students to communicate their ideas creatively. It is also significant to explore effective ways of measuring creativity, thus ensuring that future experimental research provides valuable insights into how science fiction affects creative thought processes. The literature available presents a somewhat disjointed picture of the interaction between science fiction and creativity. Though there are studies that talk about the advantages of incorporating imaginative literature in educational practices, there are still gaps in terms of specific methodologies and frameworks through which science fiction reading can be suitably associated with creativity enhancement.

Science fiction literature combines imaginative storytelling with scientific exploration, offering unique opportunities for students to engage in creative thinking. Torrance's (1966) model of creativity emphasizes three key dimensions: fluency (generating multiple ideas), originality (producing novel ideas), and flexibility (shifting between perspectives). These are particularly relevant to adolescent learners navigating diverse cognitive tasks.

Hester et al. (2016) suggest that science fiction literature can support both content-area learning and scientific literacy. Similarly, Spiegel (1984) noted that middle school students tend to prefer humorous and imaginative literature, reinforcing the genre's potential appeal.

In order to steer the experimental investigation, research questions have been formulated. These questions are designed to determine how science fiction can be applied to facilitate more creative outcomes within educational contexts, particularly in the context of middle school students. The study further presents its aims and hypotheses according to the gaps in the current literature identified, thus offering a necessary platform for the research.

Literature Review

Extensive Literature is available for the researches regarding the function of science fiction as a literary mode with possible positives for creativity in middle school pupils. Relationships between creativity and literature specifically through science fiction, has been examined using various theoretical foundations. A main framework is Torrance's model of creativity, which focuses on divergent thinking, flexibility, and originality as essential aspects of the creative process. The model is highly applicable in the educational setting as it promotes comprehension of how literature can evoke creative thinking among adolescents. In this context, earlier studies have shown that **"Middle school students show a significant preference for humorous literature, with statistical analyses revealing that humorous literature received the highest mean preference score (4.23) compared to other literature types."** (Spiegel, 1984, p. 67). This preference suggests the significance of getting students interested in genres that appeal to them, like science fiction, which tends to combine humour with creative ideas.

The assessment of the influence of science fiction on creativity has been addressed using different methodologies in educational research. Some studies have used qualitative measures, such as interviews and focus groups, to measure students' creative reactions to science fiction texts. In addition, quantitative measures, such as surveys and

standardized tests of creativity, have been used to evaluate the improvement in creative thinking skills after intervention. For example, Hester et al. (2016) state that **"Using a science fiction novel is a viable method for addressing both content literacy standards and fostering scientific literacy."** (p. 4). This highlights the two-fold significance of science fiction in assisting both creative and academic abilities, which makes it an invaluable asset in middle school education.

Most studies prefer to work in high school settings, and hence there are significant lacunae in the existing literature on the specific use of science fiction as a means to promote creativity in middle schools. Also, contemporary science fiction curricula tend to be biased. As noted by Hollar (2013), **"Current science fiction curricula in high schools predominantly feature white male authors and perspectives, implicitly excluding students of color from envisioning their own futures"** (p. 8). This realization calls on teachers to think more inclusively, inviting varied voices to enhance the literature that frames students' imaginative journeys.

Furthermore, the inclusion of science fiction in teaching methods requires a keen awareness of students' backgrounds and learning styles. Hollar (2013) reminds that **"Understanding students' backgrounds and learning styles is crucial for successful novel implementation, requiring ongoing support and professional development for content teachers to effectively integrate literacy standards into their teaching."** (p. 12). This awareness places emphasis on the need for teachers to be prepared with the right tools to enable discussions and explorations of science fiction that appeal to all students, thereby making the most of the genre's potential to stimulate creativity.

Methodologically, studies have adopted different approaches to address the influence of imaginative literature on the creative thinking process among students. Previous research demonstrates an integration of experimental approaches, comparative studies, and longitudinal evaluations to determine the long-term value of using science fiction as part of curricula. The measurement of science fiction's impact compared to conventional literary types, however, is a major challenge. The subjectivity of creativity makes it necessary to develop creative methods for assessing creativity that reflect the sensitivity of creative thought stimulated by science fiction reading. According to the literature, one of the methods that have been promising entails the integration of science fiction narratives with project-based learning, in which students design their own tales or adaptations. Such active engagement not only encourages creativity but also promotes critical thinking and peer collaboration. Through such integrations, teachers can strengthen pedagogical practices, hence developing a learning environment that flourishes on imagination and innovation.

Objectives Of The Study

1. To evaluate the impact of science fiction literature on the creativity of middle school students.
2. To examine changes in fluency, originality, and flexibility after exposure to science fiction.

Research Questions

1. Does science fiction literature significantly enhance creativity among middle school students?
2. Which dimensions of creativity are most influenced by science fiction exposure?

Variables of the Study

Independent Variable: Exposure to science fiction literature (stories, comics, and videos)

Dependent Variable: Creativity, as measured by the Researcher developed Torrance-Inspired Figural Creativity Test (TIFCT)

Controlled Variables: Age, grade level, instructional environment

Operational Definitions

Science Fiction Literature: For the purposes of this study, science fiction literature includes age-appropriate illustrated comics, short stories, and animated videos that integrate futuristic, scientific, and imaginative elements, stories written and imagined by the students themselves aimed at sparking students' creative thinking.

Creativity: Measured by the researcher-developed Torrance Inspired Test of Creative Thinking (TTCT), creativity is operationalized in terms of three dimensions: fluency (number of ideas), originality (novelty of ideas), and flexibility (variety of idea categories).

Fluency: The ability to produce numerous relevant ideas.

Originality: The capacity to generate unique or uncommon ideas.

Flexibility: The ability to shift perspectives and approaches in problem-solving.

Methodology

Research Design

A true experimental, pre-test-post-test control group design was employed. Sixty students were randomly assigned to two groups: experimental (n = 30) and control (n = 30). The experimental group received the science fiction intervention, while the control group continued with traditional instruction.

Population And Sample

The sample consisted of Grade 8 students enrolled in Rotary English Medium School. Students were randomly selected from class sections to ensure diversity.

Intervention Material

Materials included illustrated comics, animated videos, and short stories tailored to reflect age-appropriate scientific themes and real-world relevance. It also included visual figural stimulus and cues given to the students to frame the stories. Selections were intended to stimulate imagination and deepen conceptual understanding.

Intervention program

The intervention was four weeks long, with three 40-minute sessions per week. Each session was well-designed to integrate science fiction stories with active and inventive learning approaches:

- **Engagement Phase**: During the beginning of each session, students watched an animated video, read a comic, or heard a short science fiction story. These works were chosen to present major scientific concepts in interesting and futuristic environments.
- **Discussion Phase**: After viewing or reading, students participated in guided group discussions led by the teacher. The discussions were aimed at determining imaginative elements, ethical issues, technological potential, and scientific applicability within the stories.
- **Creative Task Phase:** Every session ended with a practical creative task that invited students to take the science fiction concepts further. Exercises involved sketching out-of-time inventions, creating alternate endings, crafting imaginary worlds, and developing science-inspired innovations based on the tales.

The three phase process helped the researcher draw attention of the participants in the classroom and ensure their mental engagement, emotional attachment, and active participation, all of which are integral ingredients for

cultivating creativity.

Tools Used for Data Collection

1. Torrance Inspired Tests of Creative Thinking (TITCT): This was the researcher developed test. It used figural creativity in terms of fluency, originality, and flexibility on the lines of Torrance Model to measure creativity. The tool consisted of 10 tasks based on the figures. The students were required to complete the figures.

2. Semi-Structured Interviews: Administered with 10 students of the experimental group to comprehend the creative experience.

Data Collection Procedure

The data collection process was well-planned and executed in three broad phases: pre-intervention assessment, implementation of the intervention, and post-intervention assessment. Both quantitative and qualitative data were gathered to provide an in-depth insight into the effects of science fiction literature on the creativity of students.

Both groups received a TITCT-based pre-test before the intervention. Post-test was conducted after completing the four weeks program to only experimental group. Semi-structured interviews were administered and transcribed for detailed qualitative understanding to only experimental group. Both groups received a TITCT-based post-test after the intervention

Data Analysis And Interpretation

To analyze the effect of science fiction literature on the creativity of students, quantitative and qualitative data were analyzed. The quantitative data were derived from the Torrance Tests of Creative Thinking (TITCT), which were administered prior to and after intervention. The qualitative data were collected through semi-structured interviews to record students' subjective experiences. Descriptive statistics of creativity data are described in Table 1.

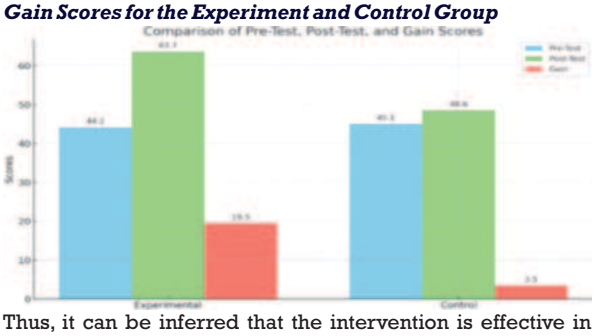
Table 1. ***Descriptive Statistics of mean pre-test, post-test, and gain Creativity Scores***

Group	N	Pre-Test	Post-Test	Gain	SD (Gain)	SED	t Value	Significance
E.G.	30	44.2	63.7	19.5	11.07	2.86	6.82	S
C.G.	30	45.1	48.6	3.5	7.36	1.90	1.84	NS

Note: *n = 30 per group. All t-tests are independent-sample comparisons of gain scores between groups.*

Table 1 shows the descriptive and the inferential data of creativity scores for the experimental and control group for the whole test. The data indicates that the students in the experimental group showed a mean gain of 19.5 points, with a t-value of 6.82, which is more than table value of 2.58 at 0.01 level, so is statistically significant at conventional levels of 0.01. This suggests a strong and reliable effect of the intervention.

Creativity Scores Comparison of Pre-Test, Post-Test and Gain Scores for the Experiment and Control Group



Thus, it can be inferred that the intervention is effective in improving the creativity scores among the middle school students.

Table 2 Dimension-Wise Comparison of TITCT Scores with Inferential Statistics

Creativity Dimension	Group	Pre-Test	Post-Test	Gain	SD Gain	SED	t-value	p-value	Significance
Fluency	E	13.8	20.1	+6.3	4.42	1.03	6.12	<.001	S
	C	14.0	15.1	+1.1	3.16	0.82	1.34	>0.05	NS
Originality	E	14.5	22.3	+7.8	5.24	1.06	7.36	<.001	S
	C	14.2	15.7	+1.5	3.04	0.79	1.90	>0.05	NS
Flexibility	E	16.0	21.4	+5.4	4.11	1.08	5.00	<.001	S
	C	16.3	17.2	+0.9	2.79	0.72	1.25	>0.05	NS

Note: *n = 30 per group. All t-tests are independent-sample comparisons of gain scores between groups.*

Table 2 data assesses the effect of an intervention science fiction literature-based programme on three key dimensions of creativity: Fluency, Originality, and Flexibility, comparing pre-test and post-test scores for both experimental and control groups.

Fluency: Experimental group improved from 13.8 to 20.1, showing a gain of +6.3. The t-value of 6.12 ($p < .001$), which is more than table value of 2.58 at 0.01 level, so is statistically significant at conventional levels of 0.01. It indicates the improvement is highly significant.

In contrast, the control group showed only a modest gain of +1.1, and t value of 1.34, which is less than table value of 2.58 at 0.01 level, so is statistically not significant at conventional levels of 0.01. Gains are likely due to natural learning progression in control group.

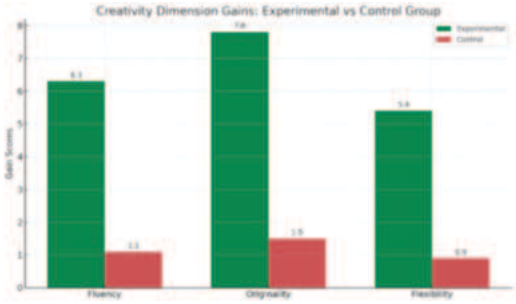
Originality: The experimental group showed a gain of +7.8 (from 14.5 to 22.3). With a t-value of 7.36 ($p < .001$), which is more than table value of 2.58 at 0.01 level, so is statistically significant at conventional levels of 0.01. It shows that the intervention effectively enhanced students' ability to produce novel ideas.

The control group gained only +1.5, with t values of 1.90 which is less than table value of 2.58 at 0.01 level, so is statistically not significant at conventional levels of 0.01. Gains are likely due to natural learning progression in the control group.

Flexibility: The experimental group improved from 16.0 to 21.4, gaining +5.4, with a t-value of 5.00 ($p < .001$), which is more than the table value of 2.58 at 0.01 level, so is statistically significant at conventional levels of 0.01. It shows that the intervention effectively enhanced students' ability to be flexible.

The control group gained only +0.9, with a t value of 1.25, which is less than the table value of 2.58 at 0.01 level, so it is statistically not significant at conventional levels of 0.01. Gains are likely due to natural learning progression in the control group.

Dimensions of Creativity Scores Comparison of Pre-Test, Post-Test and Gain Scores for the Experiment and Control Group



DISCUSSION OF RESULTS

The results of this study clearly indicate that science fiction literature significantly enhances creativity as well as various dimensions of creativity among middle school students. The experimental group, which received regular exposure to age-appropriate science fiction materials, demonstrated a statistically significant improvement in all creativity scores and all the three measured dimensions of creativity-originality, fluency, and flexibility.

Most notably, originality exhibited the greatest mean gain (+7.8) with a t-value of 7.36 ($p < .001$), indicating a large and significant effect of the intervention on students' ability to produce novel and uncommon ideas. This aligns with Appel et al. (2016), who argue that speculative fiction often requires readers to suspend disbelief and engage in creative extrapolation, both of which stimulate original thought processes.

In terms of fluency, the students in the experimental group produced a significantly higher number of ideas post-intervention ($t = 6.12$, $p < .001$), suggesting that the creative tasks inspired by science fiction texts fostered divergent thinking. These findings support Torrance's (1966) model, which identifies fluency as a core element of creativity that can be cultivated through rich imaginative inputs.

Flexibility, though slightly less impacted compared to originality and fluency, also showed a meaningful gain in the experimental group (+5.4, $t = 5.00$, $p < .001$). The flexibility score improvement indicates that students became better at switching between different modes of thinking, which may be attributed to the layered and multidimensional nature of science fiction narratives.

In contrast, the control group displayed minimal gains across all dimensions, with none reaching statistical significance. These comparative results further affirm the positive influence of science fiction exposure over traditional instructional approaches.

The qualitative data also support these outcomes, revealing increased student enthusiasm, imagination, and confidence in creative expression. Several students remarked that they began visualizing futuristic scenarios and felt empowered to explore their ideas without fear of judgment. This corroborates the views of Marozzo et al. (2024), who suggest that science fiction can serve as a trigger for innovation, especially among students with developing STEM interests.

Overall, the findings suggest that science fiction is not merely entertainment but an effective pedagogical tool that can advance creative thinking in educational contexts. Integrating such literature into the curriculum can bridge the gap between scientific content and imaginative engagement, leading to deeper learning and broader cognitive development.

Findings

Qualitative Insights

Thematic analysis of interviews revealed three key themes:

Imaginative Expansion: Students reported vivid mental imagery and futuristic thinking.

Confidence In Creativity: Many felt empowered to express unconventional ideas.

Integration Of Science And Fiction: Learners identified scientific principles within narratives and applied them creatively.

Quantitative Findings

- Science Fiction literature is effective in increasing the creativity among middle school students.
- Science Fiction literature is effective in increasing all three dimension of creativity viz. fluency, originality and flexibility among middle school students highest being the originality and least flexibility.
- Students displayed enhanced imaginative thinking, confidence, and scientific engagement.

Thus, the intervention successfully bridged fiction and science, promoting higher-order thinking. The quantitative data clearly shows that science fiction literature greatly boosts students' creativity, especially in the area of originality. The qualitative results support this by indicating that not only did students become more immersed in imaginative work but also increased their confidence and enthusiasm towards creative exploration. These findings offer strong support for both research questions and confirm the positive function of science fiction as a pedagogical instrument for fostering creativity in middle school students.

CONCLUSION

Science fiction literature provides an effective medium to foster creativity in middle school students. Since it allows blending scientific thinking and imaginative storytelling, it stimulates the students to think creatively and picture different futures. The research indicates incorporating science fiction into the classrooms to facilitate inventive thinking and conceptual interaction. Future research should explore long-term impacts and scalability across different educational settings.
